Module 4

Activities/Assessments

Question #1:
Data Governance Compliance Review

Guidelines/ Requirements:

1. Research for data governance policy of any company (Facebook/ Meta, Google, Amazon, GCash, BPI, any government websites. Any company with available privacy policy)

2. Analyze its data governance policy (Privacy policy, Data governance practices, Data collection and usage policies)

3. Write a short analysis (<500 words) covering:
Organization Overview – brief background of the company; what type of data they collect.
Data Governance Practices – how they store and manage data access control and security measures.
Strengths – what the company does well in protecting data.
Weaknesses or Risks – possible privacy risk or governance gaps
Recommendations – 2-3 improvements for better data governance.

Answer #1

GCash is a mobile wallet and financial services platform in the Philippines operated by **Mynt (Globe Fintech Innovations, Inc.)**, a subsidiary of Globe Telecom. It allows users to perform digital payments, money transfers, bill payments, online shopping, and financial services through a mobile application.

GCash collects several types of user data to provide its services. This includes **personal information** such as name, phone number, date of birth, and government identification. It also collects **financial and transaction data**, including payment history, wallet balances, and linked bank accounts. Additionally, **device and technical data** such as IP address, device identifiers, and usage activity may be collected to improve security and system performance.

GCash stores and manages user data through secure cloud systems and internal databases designed to protect financial and personal information. According to its privacy policy, data is collected only when necessary for account registration, identity verification (KYC), and financial transactions.

To protect user data, GCash implements **access controls and authentication mechanisms**, such as PIN verification, biometric login (fingerprint or face recognition), and multi-factor authentication. These measures ensure that only authorized users and personnel can access sensitive information.

The company also uses **encryption technologies** to protect data during transmission and storage. Furthermore, GCash complies with the **Philippine Data Privacy Act of 2012**, which regulates how

	organizations collect, process, and store personal information. Internal policies and security monitoring help detect unauthorized access or suspicious activities. One major strength of GCash’s data governance is its strong identity verification system (KYC), which reduces fraud and ensures legitimate users. Another strength is the implementation of multiple security layers, such as biometric authentication and transaction alerts. GCash also demonstrates transparency by publishing a clear privacy policy that explains how user data is collected, used, and protected. Despite strong protection, some risks still exist. Since GCash is a digital financial platform, it is a potential target for cyberattacks and phishing scams. Users may also unintentionally expose their credentials through social engineering attacks. Another possible issue is third-party service integration, where data shared with partners could introduce privacy risks if not properly managed. My recommendations for a better data governance of Gcash are: 1. Enhance user education programs about phishing scams and safe digital practices to reduce user-related security risks. 2. Strengthen third-party data governance policies to ensure that partners follow the same privacy and security standards. 3. Increase transparency in data retention policies, clearly stating how long user data is stored and when it is deleted.
